Acceleration of Biomedical Image Processing with Dataflow

Acceleration of Biomedical Image Processing with Dataflow on FPGAs covers the transformation of image processing algorithms towards a system of deep pipelines that can be executed with very high parallelism. The transformation process is discussed from initial design decisions to working implementations.

Acceleration of Biomedical Image Processing with Dataflow

In this thesis the potential of FPGA acceleration is examined for applications that perform biomedical image processing and reconstruction. The dataflow paradigm was used to port the analysis of image data for localization microscopy and for 3D electron tomography on an FPGA.

Acceleration of Biomedical Image Processing and Reconstruction with FPGAs Increasing chip sizes and better programming tools have made it possible to increase the boundaries of application acceleration with reconfigurable computer chips. In this thesis the potential of acceleration with Field Programmable Gate Arrays (FPGAs) is examined for applications that perform biomedical image processing ...

GPU Acceleration on Image processing, machine decision

Addressing the application of standard and novel processing techniques to some of today's principle biomedical signals and images over three sections, the book begins with an introduction to digital signal and image processing, including Fourier transform, image filtering, edge detection, and wavelet transform.

In biomedical application, in order to find the detail of the images, it is necessary to process the images. Edge detection is one of the operation of identifying the boundaries which help in diagnosing the disease in biomedical application.
