Multiple myeloma, also known as plasma cell myeloma, is a cancer of plasma cells, a type of white blood cell normally responsible for producing antibodies. Often, no symptoms are noticed initially. When advanced, bone pain, bleeding, frequent infections, and anemia may occur. Complications may include amyloidosis.. The cause is unknown. Risk factors include obesity, radiation exposure, family ...

### **Multiple myeloma - Wikipedia**

Multiple myeloma is a cancer that begins in plasma cells, a type of white blood cell. These cells are part of your immune system, which helps protect the body from germs and other harmful substances.

A myeloma protein is an abnormal immunoglobulin fragment, such as an immunoglobulin light chain, that is produced in excess by an abnormal monoclonal proliferation of plasma cells, typically in multiple myeloma. Other terms for such a protein are M protein, M component, M spike, spike protein, or paraprotein. This proliferation of the myeloma protein has several deleterious effects on the body ...

Menopause is the time in a woman's life when her normal menstrual periods have stopped for at least 12 months and she can no longer become pregnant. Not all women will have laboratory testing, but women with menopausal symptoms who may have premature ovarian failure or who are being evaluated for risk of other health problems, such as osteoporosis, may have one or more lab tests done.
